## Complex Requirements, Less Time

Once you receive new specifications from your customers, the clock starts ticking. If you want to stay a step ahead of the competition, you have to be the first to react. Before you can do that, a large number of requirements have to be read, checked, and evaluated – manually. Even though much of the content differs only slightly from what was already checked.

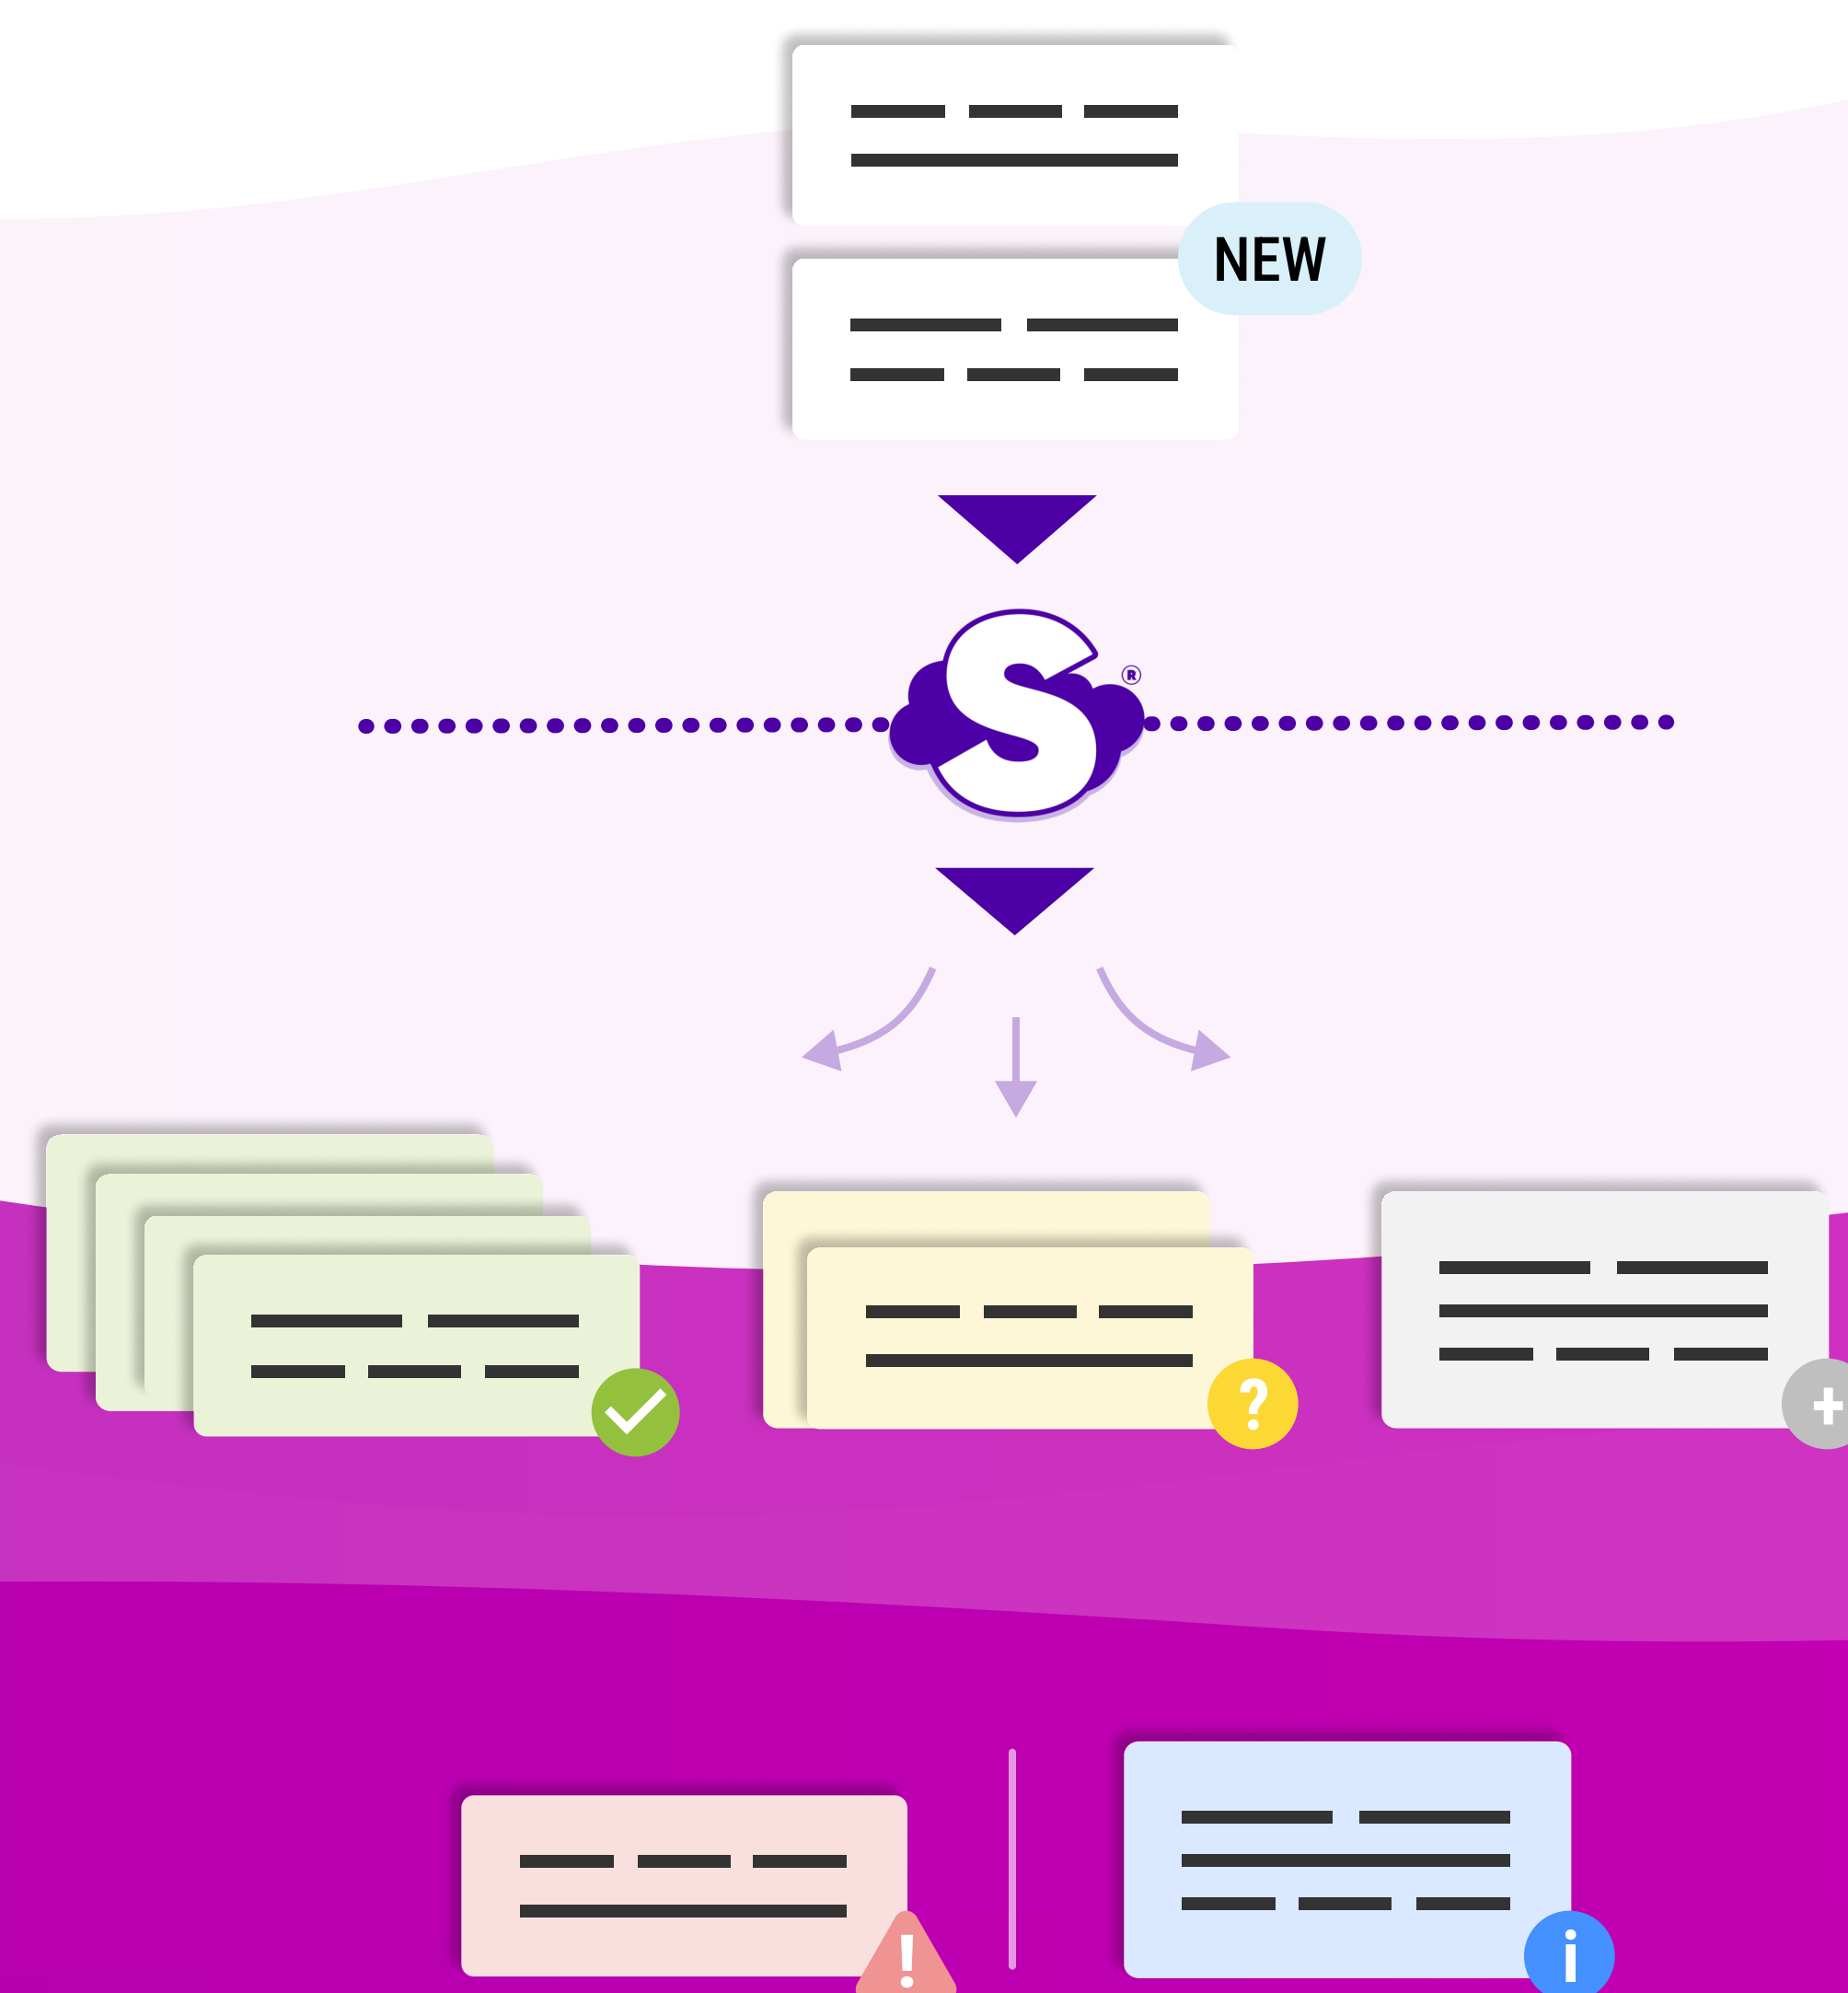

This not only costs time and money – it's also error-prone. But there are other challenges as well. Requirements are becoming more complex, while turnaround times are getting shorter. At the same time, the number of experienced professionals is decreasing. So how can you quickly create high-quality quotes for your customers?

## semantha: The Key to Requirements

Previously evaluated requirements provide the foundation in semantha. On this basis, new requirements are classified automatically.

semantha also identifies risks and provides references to external standards and applicable documents.

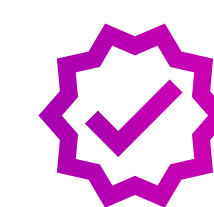

semantha reads and understands large amounts of text in any language, and finds the content you're looking for – no matter how it's worded. What you need several hours for, semantha can do in a few seconds thanks to artificial intelligence – and with no training needed.

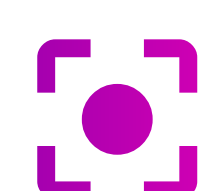

It enables you to compare, analyze, and evaluate data efficiently. At the same time, you identify potential risks and ensure quality.

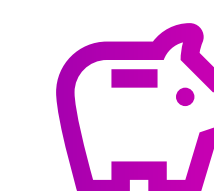

Save an average of 40% time in replying to customer requirements.

Find those important details and minimize potential risks

Focus on the core issues where your expertise is required.

Save money on faster processing and accept more requests.
